the 1990s, the number of people in the UK who are obese has increased by 50% (Health Survey for England 1995).

Obesity is a complex condition, with many causes. It is a result of an imbalance between energy intake and energy expenditure. The energy intake is determined by the amount of food and drink consumed, and the energy expenditure is determined by the amount of physical activity. The balance between these two factors is what determines whether a person is overweight or obese.

There are many factors that can influence energy intake and expenditure. These include genetics, environment, and lifestyle. For example, a person's diet and physical activity levels can have a significant impact on their weight.

Obesity is a major public health problem. It is a leading cause of death and disability in the UK. It is also a major risk factor for many other health problems, including heart disease, diabetes, and cancer.

There are many ways to prevent and treat obesity. These include diet, exercise, and surgery. The best way to prevent obesity is to eat a healthy diet and get regular exercise.

Obesity is a complex condition, and it is important to understand the many factors that can influence it. By understanding the causes of obesity, we can develop better ways to prevent and treat it.

Obesity is a major public health problem. It is a leading cause of death and disability in the UK. It is also a major risk factor for many other health problems, including heart disease, diabetes, and cancer.
